

Year of Validity: 2026

Based on our company's assessment, Ontoz dry membrane elements are manufactured articles and are classified as an "Article" under the OSHA Hazard Communication Standard. An "Article" is a manufactured product that is formed into a specific shape or design during production and whose intended function depends on that shape or design. Under normal conditions of use, an Article does not release more than a minimal or trace amount of hazardous chemicals and therefore does not present a physical or health hazard to employees.

Accordingly, manufactured Articles are not required to have a Material Safety Data Sheet (MSDS). MSDS documentation applies to the chemical solutions used with wet membrane elements and modules for their storage and transportation. In accordance with 29 CFR 1910.1200 (OSHA Hazard Communication Standard), the membrane elements, modules, and components supplied as finished products are not classified as hazardous chemicals.

We sincerely appreciate your business and remain committed to providing high-quality products and reliable service. Should you require any additional information or have questions regarding our products, please contact us through the www.ontoz.in website.
